Chicken Wing Dissection Lab - BetterLesson  
Although the chicken wing and the human arm are both limbs, they are not completely the same. The chicken wing and the arm both have skin on the outside with fat and muscle underneath. There are a different number of muscles and tendons in the wing compared to the arm because there are different bones to move.

---

Chicken wing dissection - SlideShare  
Wing: 14. Move the wing again. Explore how the muscles, tendons, ligaments and cartilage play roles in the wings movement. 15. Finally, remove one of the bones and break in half. Observe the external and internal components of the bone. 16. Complete the observation table. When you have finished observing the wing, throw the chicken remains away.

Chicken Wing Lab | Tissue (Biology) | Adipose Tissue  
We pulled on the muscle and the wing moved because when we pull on the biceps muscle, the wing extends. But when we pull on the tricep muscle, the wing goes back to its relaxing state. Explanation Conclusion In conclusion, the chicken wing needs the ligaments, tendons, and bones

---

Chicken Wing Dissection Lab Answers  
Chicken Wing Dissection How do the muscles, bones, and tendons work together to move a joint of a chicken wing and how do they compare to a human arm? Although many differences exist between the anatomy of humans and chickens, one structure that shows similarities in muscle pairing and range of motion is a bird's wing.

---

Handling Dissection Procedure with Chicken Wing Dissection ...

---

Chicken Wing Anatomy Lab  
This answers our questions: what structures are under the skin and how do they work together to allow the wing to move like that? Nerves tell the wing what to do but the muscles and the tendons and the bones are all connected and moving to allow the entire wing to move like a chicken wing does. Go ahead and put your wind down if you haven't.
